

# SUPPORT VECTOR MACHINE

# Agenda

- What is SVM?
  - Ideology behind SVM
  - Intuition Development
  - Terminologies used in SVM
  - How does it work?
  - What is Kernel trick?
- Types of kernel
    - Polynomial Kernel
    - Gaussian RBF Kernel
  - Support Vector Regression
  - Pros and Cons of SVM
  - Data preparation for SVM
  - Use Case - House Prices

# What is SVM?

**Supervised learning algorithm** which can be used for,

**Classification** - **Support Vector Classification (SVC)**

**Regression** - **Support Vector Regression (SVR)**

# What is SVM?

Used for **smaller dataset** as it takes **too long to process**.

# Agenda

- What is SVM?
  - Ideology behind SVM
  - Intuition Development
  - Terminologies used in SVM
  - How does it work?
  - What is Kernel trick?
- Types of kernel
    - Polynomial Kernel
    - Gaussian RBF Kernel
  - Support Vector Regression
  - Pros and Cons of SVM
  - Data preparation for SVM
  - Use Case - House Prices

# The ideology behind SVM

SVM is based on the idea of finding a **hyperplane** that best separates the features into different domains.

# What is Hyperplane?

We can draw a **line in 2-D**, a **plane in 3-D**, anything beyond is a **hyperplane**.

# Agenda

- What is SVM?
  - Ideology behind SVM
  - **Intuition Development**
  - Terminologies used in SVM
  - How does it work?
  - What is Kernel trick?
- Types of kernel
    - Polynomial Kernel
    - Gaussian RBF Kernel
  - Support Vector Regression
  - Pros and Cons of SVM
  - Data preparation for SVM
  - Use Case - House Prices

# Intuition Development

Classify emails as **spam** or **ham** using a **function(hyperplane)**

Two cases in which the hyperplane are drawn, which one will you pick and why?

# Intuition Development

- I guess you would have picked the **fig(a)**.

Did you think **why** have you picked the fig(a)?

- Because the **emails in fig(a)** are **clearly classified** and **you** are **more confident** about that **as compared to fig(b)**.

# Intuition Development

## Hyperplane(Decision Surface)

- The hyperplane is a **function** which is used to **differentiate between features**.
- In a **2-D data**, the function used to classify is a **LINE**.

# Intuition Development

## Hyperplane(Decision Surface)

- The function used to classify the features in a **3-D data** is a **PLANE**.
- Beyond **3-D** its a **HYPERPLANE**.

# Intuition Development

Basically, SVM is composed of the idea of coming up with an **Optimal hyperplane** which will **clearly classify the different classes**.

(In this case they are **binary** classes)

# Agenda

- What is SVM?
  - Ideology behind SVM
  - Intuition Development
  - Terminologies used in SVM
  - How does it work?
  - What is Kernel trick?
- Types of kernel
    - Polynomial Kernel
    - Gaussian RBF Kernel
  - Support Vector Regression
  - Pros and Cons of SVM
  - Data preparation for SVM
  - Use Case - House Prices

# Terminologies used in SVM

- The **points closest** to the **hyperplane** are called **SUPPORT VECTORS**.
- The **distance** of the **vectors from** the **hyperplane** is called **MARGIN**.

# Terminologies used in SVM

# Agenda

- What is SVM?
  - Ideology behind SVM
  - Intuition Development
  - Terminologies used in SVM
  - How does it work?
  - What is Kernel trick?
- Types of kernel
    - Polynomial Kernel
    - Gaussian RBF Kernel
  - Support Vector Regression
  - Pros and Cons of SVM
  - Data preparation for SVM
  - Use Case - House Prices

# How does it work?

We got accustomed to the process of segregating the two classes with a hyper-plane.

Now the burning question is “**How can we identify the right hyper-plane?**”.

# How does it work?

## Scenario-1 (Linearly Separable Data)

### Identify the right hyper-plane :

- Here, we have three hyper-planes (A, B and C).
- Now, identify the right hyper-plane to classify star and circle.

# How does it work?

## Scenario-1 (Linearly Separable Data)

You need to remember a thumb rule to identify the right hyper-plane

- Select the hyper-plane which segregates the two classes best.
- In this scenario, **hyper-plane "B"** has excellently performed this job.
